

THE PROBLEM · ELIGIBILITY DRIFT

Every RWA project stops at issuance. Talon runs what happens **after** — coupons, dividends, redemptions — and fixes the one failure only *verified* assets have.

A holder is verified on the **record date** and earns a coupon. By the **pay date** — days later — their Cleanverse A-Pass has frozen or expired, through no fault of their own. Now every payout is a trap:

✗ Pay them anyway

A **compliance violation** — and the A-Token reverts on-chain anyway.

✗ Withhold the coupon

Theft. They earned it while fully verified. An expired document isn't a forfeiture of property.

This exists only because Cleanverse identity is revocable and expiring. On a plain ERC-20 there is nothing to drift — Talon could not be built on anything else.

THE SOLUTION · PAY WHERE COMPLIANT, ESCROW WHERE NOT, NEVER FORFEIT

- At pay date, Talon attempts the **real transfer**, holder by holder.
- Still compliant** → paid directly, with a Travel Rule report for that exact tx.
- Reverts** → escrowed **per-beneficiary**, tagged with the chain's own reason — **never forfeited** (there is deliberately no admin-confiscation function).
- Release = a retry of that same real transfer** — if it succeeds, the holder is genuinely eligible again.

We never re-implement compliance.

The A-Token's own on-chain revert **is** our compliance check. Eligibility stays Cleanverse's verdict — the chain is the source of truth, and we only react to it.

CVI · CVA INTEGRATION — 6, ALL LIVE, NONE MOCKED

A-Pass · CVI	the revocable, expiring credential the whole product reacts to
A-Token · CVA	its on-chain revert IS our compliance check
generate_apass	the vault holds its own A-Pass so it can custody A-Tokens
query_apass	poll holder eligibility — Cleanverse ships no webhook
update_status	freeze / reinstate a holder live from the dashboard
download_travel_rule	per-payout report, stored as bytes

Depth, not surface: frozen (`0x322fde89`), expired (`0xaec0db0e`) and no-pass are three **distinct on-chain reasons**, never conflated — because lapsed ≠ sanctioned. Revert data even names the offending party, so one holder's failure never mis-blames another.

DEPLOYED · MONAD TESTNET 10143

Contracts **deployed & frozen**; both coupon & asset are real A-Tokens.

EscrowVault `0xb634379B2afdf12830eae694cFeaE80fB0dFFB7`

CorporateActionManager

aUSDC coupon · TLNB "Talon Bond 2026" asset — all on testnet.monadscan.com

BUILD QUALITY & SCALE

- One vault, every asset** — a single vault custodies any number of A-Tokens; resumable, paginated batched payouts; no per-issuance redeploy.
- 90 tests green** — unit, fuzz & cross-contract invariants (256×64): `sum(ledger) ≤ balanceOf(vault)`.
- Proven with money that moves** — live smoke on real aUSDC: paid, then frozen → escrow → reinstate → release → claim.
